### Acoustic Metamaterials And Phononic Crystals

An acoustic metamaterial, sonic crystal, or phononic crystal, is a material designed to control, direct, and manipulate sound waves or phonons in gases, liquids, and solids (crystal lattices). Sound wave control is accomplished through manipulating parameters such as the bulk modulus  $\beta$ , density  $\rho$ , and chirality. They can be engineered to either transmit, or trap and amplify sound waves at ...

### Acoustic metamaterial - Wikipedia

Phononic crystals are artificial periodic composite materials consisting of periodically distributed individuals (single acoustic functional scatter) in a matrix with high impedance contrast of mass densities and/or elastic moduli, which can give rise to new acoustic dispersions and band structures due to the periodic Bragg scattering as well as localized Mie scatterings from the individuals.

Unlike phononic crystals, which derive their unique properties from the mutual interaction of elements whose size and spacing are on the order of a wavelength, acoustic metamaterials rely on subwavelength structure—both in the geometry of the individual elements and in the spacing between them—and self-interaction to generate novel behaviors.
