### Application Of Derivatives Tangents And

1. Tangents and Normals. by M. Bourne. We often need to find tangents and normals to curves when we are analysing forces acting on a moving body. A tangent to a curve is a line that touches the curve at one point and has the same slope as the curve at that point.. A normal to a curve is a line perpendicular to a tangent to the curve.

Don't worry if you can't because that's what this branch of application of derivatives is concerned with: Finding tangents and normals to a given curve. It is a branch of great significance in finding the different maxima and minima of a function, analyzing the directions of velocity and acceleration of a moving object, finding the angles and the shortest distance between two curves and ...

Let us consider some examples. Example 1 Find the rate of change of the area of a circle per second with respect to its radius  $r$  when  $r = 5$  cm. Solution 2The area  $A$  of a circle with radius  $r$  is given by  $A = \pi r^2$ .
