Geometry (from the Ancient Greek: γεωμετρία; geo-"earth", -metron "measurement") is, with arithmetic, one of the oldest branches of mathematics.It is concerned with properties of space that are related with distance, shape, size, and relative position of figures. The complex numbers are the field \mathbb{C} of numbers of the form $x+iy$, where x and y are real numbers and i is the imaginary unit equal to the square root of -1 , $\sqrt{-1}$. When a single letter $z=x+iy$ is used to denote a complex number, it is sometimes called an "affix." In component notation, $z=x+iy$ can be written (x,y) . The field of complex numbers includes the field of real numbers as a subfield.

Euclidean geometry is a mathematical system attributed to Alexandrian Greek mathematician Euclid, which he described in his textbook on geometry: the Elements.Euclid's method consists in assuming a small set of intuitively appealing axioms, and deducing many other propositions from these.Although many of Euclid's results had been stated by earlier mathematicians, Euclid was the first to show ...

where r is a positive real number called the complex modulus of z , and θ (sometimes also denoted ϕ) is a real number called the argument.The argument is sometimes also known as the phase or, more rarely and more confusingly, the amplitude (Derbyshire 2004, pp. 180-181 and 376).. The complex argument of a number is implemented in the Wolfram Language as $\text{Arg}[z]$.
