### Mastitis Control In Dairy Herds

Bovine mastitis is the persistent, inflammatory reaction of the udder tissue due to physical trauma or microorganisms infections. Mastitis, a potentially fatal mammary gland infection, is the most common disease in dairy cattle in the United States and worldwide. It is also the most costly disease to the dairy industry. Milk from cows suffering from mastitis has an increased somatic cell count.

### Mastitis in dairy cattle - Wikipedia

Beef and Dairy Cattle Vaccination Programs Introduction Infectious diseases threaten beef and dairy cattle health and welfare and can decrease productivity and profitability. Vaccination is an important component of control and prevention of these diseases. A vaccination program, however, is not a substitute for good nutrition,

### Beef and Dairy Cattle Vaccination Programs

Dairy herds fed conventionally should feed grain at least twice daily. For cows milking over 80 pounds, feeding grain three to four times per day would be ideal. Hay or some forage should be fed before grain is offered. Herds feeding a total mixed ration (TMR) should monitor dry matters on all high moisture feeds on a regular basis.

### Prevention and Control of Foot Problems in Dairy Cows

Asymptomatic carriers can exist and make control efforts difficult. The three major symptoms of CA are mastitis, arthritis, and keratoconjunctivitis. Infected goats and sheep can have severe lameness as a result of the polyarthritis, hot swollen joints, weight loss, and fever. Some animals develop diarrhea and increased respiratory rates.

This means high production from healthy animals not suffering from any kind of disease. Mastitis is the most common and costly disease in dairy herds. In many cases the farmer is only aware of the clinical cases. It has been reported that clinical mastitis rates are generally 20-100 cases/100 cows per year.

### **PRIMARY PRODUCTION OF MILK | Dairy Processing Handbook**

In 2019, the average cow in the U.S. dairy industry was forced to produce more than 23,000 lbs. of milk in a year — more than double the amount produced 40 years before. Breeding cows to produce at such unnaturally high levels, combined with damage caused to the udders by milking machines, contributes to high levels of mastitis.

Prevention is the most cost-effective way to manage Johne's disease. It is far less expensive to block introducing Johne's disease into a herd/flock than it is to control or eradicate the infection once it creeps in and invisibly starts to spread. Testing ill looking animals can confirm whether Johne's disease is present.
