This chapter deals with the objective of multiphase flow metering (MFM)—that is, to determine the flow rates of the individual components. If homogeneity of flow can be achieved, then three instruments are required each measuring a characteristic of the mixed fluid flow.

Multiphase Flow Metering Principles - ScienceDirect

A multiphase flow meter is a device used to measure the individual phase flow rates of constituent phases in a given flow (for example in oil and gas industry) where oil, water and gas mixtures are initially co-mingled together during the oil production processes.
