NFS performance is heavily affected by the latency and bandwidth of the underlying network. Before embarking on a detailed investigation into a specific area of NFS, it is a good idea to first verify that the underlying network is performing as expected.

Optimizing NFS Performance

The most common recommendation for better NFS performance is to set the MTU on both the NFS server and the NFS client to 9000 if the underlying network can accommodate it. A study by Dell a few years back examined the effect of an MTU of 1500 compared with an MTU of 9000 .
