For a mandibulectomy (or mandibular resection), the surgeon removes all or part of the jaw bone (mandible). This operation may be needed if the tumor has grown into the jaw bone. If a tumor near the jaw is hard to move when the doctor examines it, it often means that the cancer has grown into the jaw bone.

Surgery for Oral Cavity and Oropharyngeal Cancer

Orthognathic surgery is the surgical correction of skeletal abnormalities of the mandible, maxilla or both. The underlying abnormality may be congenital (intrinsic), present at birth. These abnormalities may be recognized at birth or may not become obvious until the individual grows and develops.

Criteria for Orthognathic Surgery

Receding lower jaw; Protruding lower jaw; The surgeon makes cuts behind the molars and lengthwise down the jawbone so the front of the jaw can move as one unit. The jaw can then be moved to its new position either forward or backward. Plates and screws hold the jawbone together as it heals. Chin surgery (genioplasty)

Jaw surgery - Mayo Clinic

The mandible osteotomy is intended for those with a receded mandible (lower jaw) or an open bite, which may cause difficulty chewing and jaw pain. For this procedure cuts are made behind the molars , in between the first and second molars , and lengthwise, detaching the front of the jaw so the palate (including the teeth and all) can move as one unit.
